Introduction

The electric vehicle (EV) sector in India has witnessed a remarkable surge, thanks to the rapid growth of battery storage technologies. In the financial year **2022-23**, EV sales in India reached an impressive **12,43,258 units**. This surge is a testament to the advancements in battery technology, which have made EVs more practical and accessible for consumers. Furthermore, the number of public charging stations has significantly increased, providing a more convenient charging experience. The implementation of swappable battery technology has also gained traction, reducing charging time and enhancing convenience for EV owners. The establishment of domestic battery manufacturing capacity, coupled with advancements in lithium-ion battery technology, has further fueled the growth of the EV sector in India.
