The battery pack typically refers to the combination of a battery, its processing, and assembly into lithium-ion battery packs. The key aspects involve processing the cells, battery protection plates, connectors, and labels to create the desired products for customers.

Battery packs are crucial in lithium-ion battery pack factories, which have their pack structure design, electronic design, and production workshops. These facilities can independently develop and design based on customer needs, reaching them through battery methods, specifications, and samples. Once the customized PACK lithium-ion battery requirements are confirmed, the production line will manufacture and process the PACK, followed by quality inspection and shipment.

The main points of the manufacturing process for lithium-ion battery pack energy storage power products are as follows:

Selection and Matching Group

Battery sorting involves selecting appropriate variables like internal resistance, polarization resistance, open-circuit voltage, rated capacity, charge/discharge efficiency, and self-discharge rate. The batteries are then classified based on their parameter consistency and grouped accordingly.

This process enhances the internal characteristic consistency of the batteries, improving the module's efficiency and extending its service life. Battery sorting methods include single-factor, multi-factor, and dynamic sorting approaches.

A matching method for lithium batteries includes the following steps:
