

Indian Government Policies For E-Mobility

Role of the Indian Government in Promoting E-Mobility

Introduction

Electric mobility, or E-mobility for short, has been growing at a rapid pace worldwide in recent years. As people become more aware of the impact of traditional fossil fuel vehicles on the environment, they are turning towards electric vehicles (EVs) as a cleaner and more sustainable alternative.

The growth of E-mobility has been particularly significant in countries such as **China, Norway, and the United States**, where government policies and incentives have encouraged the adoption of EVs. India has recognized the importance of E-mobility and has taken steps to promote its adoption. The Indian government's **National Electric Mobility Mission Plan (NEMMP)** aims to maximize its EV fleet by 2030. To achieve this goal, the government has provided incentives for manufacturers and buyers of EVs, including tax exemptions and subsidies.
