Many electric vehicle manufacturers prefer using crackless lithium-ion batteries for a longer life. The preference is made due to a pre-formed concept that says cracking shortens the lifespan of the battery.

A study published in **Energy and Environmental Sciences** by Yiyang Li, an assistant professor of materials science and engineering, contradicts the above view. **"Many businesses are interested in producing 'million-mile' batteries with non-cracking particles. Sadly, without the additional surface area provided by the cracks, the battery particles will not be able to charge as rapidly,"** said **Yiyang Li**, an assistant professor of materials science and engineering and the study's corresponding author.
