The electric vehicle (EV) revolution is gaining serious traction in India, but a crucial piece of the puzzle remains – localization of lithium-ion (Li-ion) cell manufacturing. As a leading provider of Li-ion battery assembly line solutions, I have been following the surge in public interest. One thing that I am noticing continuously is that a lot of players in the automotive segment have announced a big chunk of investment in lithium-ion cell production. Let's spare this for some announcements.

Jobs and Growth Taken Seriously

Companies like [Ola Electric](#), [@](#), and [Rajesh Exports Ltd](#) are leading the charge. Ola Electric's upcoming plant in Bengaluru promises to create **5,000 jobs** across various disciplines. Similarly, Reliance aims to generate **10,000 jobs** through its giga factory project, with a focus on skilled labor in areas like cell manufacturing, automation, and quality control. These are just a few examples, and the overall impact on job creation is expected to be significant.

Benefits for Li-ion Battery Assembly Players

The rise of domestic cell production is a win-win situation for Li-ion battery assembly players. Those in the assembly domain would not be exposed to harsh tax policies and import hassles. They can offer expertise in designing and integrating **domestically produced cells** from companies like these into efficient assembly lines for leading EV manufacturers like [Mahindra Group](#) and [TVS Motor Company](#). This not only strengthens the supply chain but also fosters a collaborative environment that benefits the entire EV ecosystem.

A Rising Tide Beyond the EV Industry

The ripple effects of domestic Li-ion cell production extend far beyond the EV industry. Companies dealing in raw materials like [Gujarat Mineral Development Corporation \(GMDC\)](#), which recently

announced plans to mine lithium in India, will experience a significant boost in demand. Additionally, the need for robust safety regulations and recycling infrastructure will create opportunities for environmental consultancies and waste management companies like **Evoke Electric**, a leader in EV battery recycling solutions.

Multiple States With the Same Vision

Adding to the excitement, **Ather Energy**, a prominent electric two-wheeler manufacturer, recently announced its plans to set up a new manufacturing plant in Maharashtra's Aurangabad district. This marks Ather's first venture outside of Tamil Nadu and signifies the growing confidence in domestic Li-ion cell production. Their new facility, expected to be operational soon, will not only manufacture Ather's electric scooters (like the Ather 450X) but also produce Li-ion battery packs, creating a more vertically integrated operation. This strategic move by Ather is expected to generate around **4,000 jobs** and further bolster the EV ecosystem in Maharashtra.

The Future is in the Collaboration

While India takes a giant leap towards self-sufficiency in Li-ion cell production, collaboration between established players and new entrants is paramount. At **Semco**, we are committed to working with both the old players who are seen as market giants and those who call themselves a startup.

This era of domestic Li-ion cell production presents a golden opportunity for India to not only be a major EV player but also a leader in clean energy solutions. By embracing innovation and fostering collaboration, we can collectively usher in a greener future for the nation.
